SUMMARY

365 Wm^{-2} IS MEAN VALUE OF TSI DURING PERIODS OF MINIMUM SOLAR MAGNETIC ACTIVITIY.

.4 Wm^{-2} [0.1 %] IS THE MAGNITUDE OF THE 11-YEAR SUNSPOT CYCLE], LONG-TERM TSI VARIABILITY COMPONENT.

4-YEAR DATA BASE OF TSI MEASUREMENTS DOES NOT SUGGEST THE PRESENT OF ANY ADDITIONAL LONG-TERM TSI COMPONENTS.

1365 Wm^{-2} APPEARS TO BE THE BEST VALUE OF TSI DURING PERIODS OF MINIMUM SOLAR MAGNETIC ACTIVITIY.

1.4 Wm^{-2} [0.1 %] IS THE MAGNITUDE F THE 11-YEAR SUNSPOT CYCLE], ONG-TERM TSI VARIABILITY OMPONENT.

24-YEAR DATA BASE OF TSI EASUREMENTS DOES NOT UGGEST THE PRESENT OF ANY DDITIONAL LONG-TERM TSI OMPONENTS.

OUTLINE

ESCRIPTIONS OF MECHANISMS OF TSI VARIABILITY

SI CHARACTERIZATIONS USING SOLAR MAGNETIC INDICES.

RESENTATION OF LONG-TERM SPACECRAFT TSI DATA SETS.

NALYSES OF TSI DATA SETS.

DESCRIPTIONS OF MECHANISMS OF TSI VARIABILITY.

ONG-TERM, TSI BRIGHTENING
IS ATTRIBUTED TO FACULAE.

SHORT-TERM, TSI DARKENING
IS ASSOCIATED WITH
SUNSPOTS.

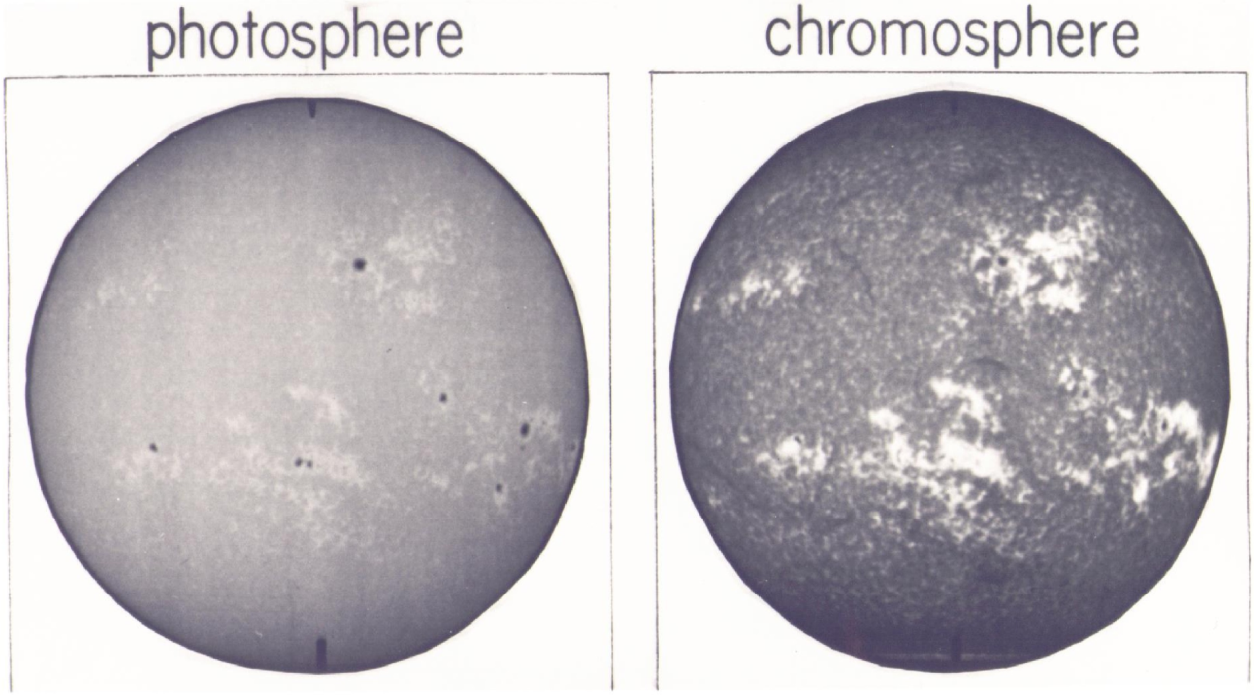
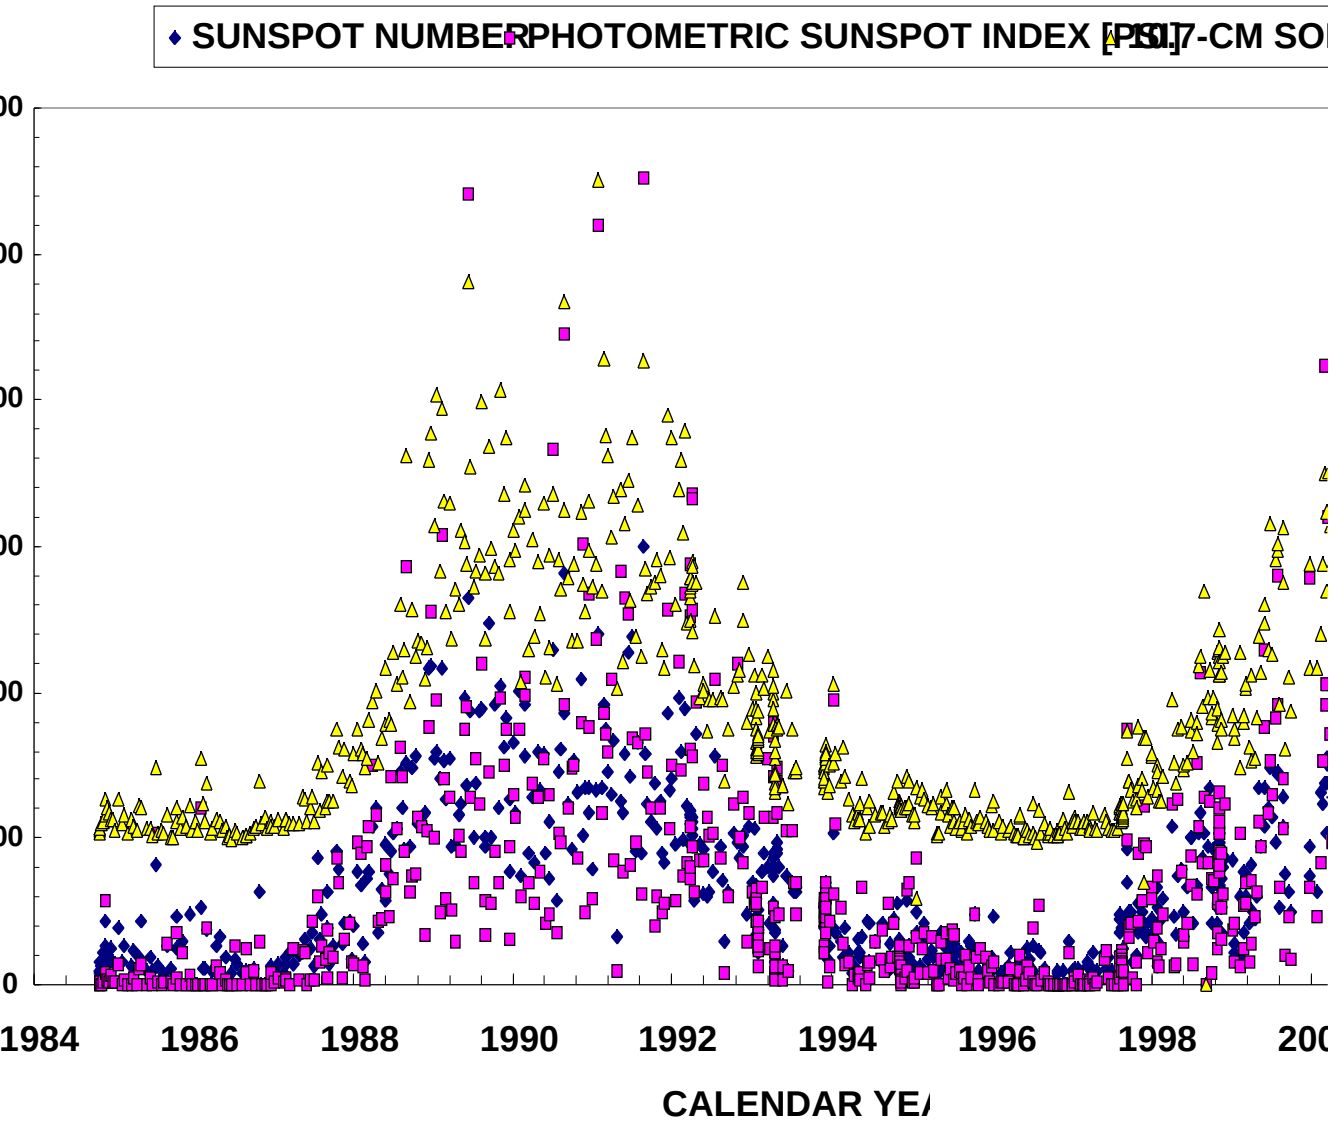
SUNSPOTS



SOLAR MAGNETIC ACTIVITY INDICES



TSI CHARACTERIZATIONS USING SOLAR MAGNETIC INDICES.

RB. LEE & RS WILSON

0.7-CM SOLAR RADIO FLUX IS A PROXY FOR LONG-TERM, TSI BRIGHTENING - ATTRIBUTED TO FACULAE.

HOTOMETRIC SUNSPOT INDEX [PSI] IS THE BEST PROXY FOR SHORT-TERM, TSI DARKENING - ASSOCIATED WITH SUNSPOTS.

REGRESSION FIT MODEL

THE MODEL IS DERIVED FROM MULTI-REGRESSION ANALYSIS OF THE MARCH 1985 TO AUGUST 1989 ERBS IRRADIANCE MEASUREMENTS, THE CORRESPONDING PHOTOMETRIC SUNSPOT INDEX (PSI, SUNSPOT DARKENING), AND THE 10.7-CM SOLAR RADIO FLUX (F10,FACULAE BRIGHTENING) VALUES. THE RESULTING IRRADIANCE REGRESSION FIT I*, ARE

$$I_{ERBS} = 1362.9 - (7053 \times PPSI) + [0.02953 \times 10^{22} (F10)] - [0.00005 \times 10^{44}(F10)^2]$$

AND

$$I_{N7} = 1369.9 - (592 \times PPSI) + [0.02561 \times 10^{22} (F10)] - [0.00005 \times 10^{44}(F10)^2]$$

WHERE F10 IS EXPRESSED IN SOLAR FLUX UNITS (1 sfu=10^{-22} Wm^{-2} Hz^{-1}) AND PPSI IS EXPRESSED IN UNITS OF 10^{-5} Wm^{-2}.
